Chapter 1: A Tour of Computer System
1.1 Information is Bits + Context

> 1 本节主要介绍了文件信息在计算机系统中是以什么形式存储的，比如我们的hello.c源文件，在计算机系统中是如何识别每个字符。

```c
#include <stdio.h>

int main()
{
        printf("hello, world\n");
        return 0;
}
```

- Our hello program begins life as a source program (or source file) that the programmer creates with an editor and saves in a text file called hello.c.
- The source program is a sequence of bits, each with a value of 0 or 1, organized in 8-bit chunks called bytes.
- Each byte represents some text character in the program.
- Most computer systems represent text characters using the ASCII standard that represents each character with a unique byte-size integer value.

Dec	Hx	Oct	Char		Dec	Hx	Oct	Html	Chr	Dec	Hx	Oct	Html	Chr	Dec	Hx	Oct	Html	Chr

- The hello.c program is stored in a file as a sequence of bytes. Each byte has an integer value that corresponds to some character.

#	i	n	c	l	u	d	e	SP	<	s	t	d	i	o	.

32	32	32	114	101	116	117	114	110	32	48	59	10	125	10	

```
1    ascii value of '#' = 35
2    value in bits: 0b 0010 0011
3
4    ascii value of 'i' = 105
5    value in bits: 0b 0110 1001
6
7    ascii value of 'n' = 110
8    value in bits: 0b 0110 1110
9
10   ...
11
```

- finally it will be a binary file in computer system:

```
1    0010 0010 0110 1001 0110 1110 ...
```

- The representation of hello.c illustrates a fundamental idea: All information in a
  system—including disk files, programs stored in memory, user data stored in memory, and
  data transferred across a network—is represented as a bunch of bits. The only thing that
  distinguishes different data objects is the context in which we view them.

```
1    0b 0110 1110 can be 110 in integer, 'n' in character ...
```
